ABSTRACT:

An antigenic composition includes antigens obtainable from Campylobacter jejuni and may be used as a vaccine to induce protective antibodies against both Campylobacter coli and Campylobacter jejuni. The antigenic composition, and antisera specific to the antigens can be used to detect Campylobacter coli or Campylobacter jejuni infection. Diagnostic detection kits include the novel antigenic composition or antisera thereto.

ABSTRACT:

The present invention provides an isolated nucleic acid encoding an approximately 26 kilodalton antigen, PEB1A, of *Campylobacter jejuni*, or an antigenic fragment thereof, wherein the antigen is associated with diarrheal disease. The present invention also provides methods of detecting the presence of a *Campylobacter jejuni* strain possessing the PEB1A antigen in a subject. Vaccines and treatments for *C. jejuni* infection are provided, as is a mutant *C. jejuni* not expressing a functional PEB1A antigen.
